1. Introduction

A Contact Manager is a software application designed to store, manage, and organize contact information efficiently. It helps users maintain details such as names, phone numbers, email addresses, and other personal information in a structured format. Instead of storing contacts manually, the system allows users to access, update, and manage contacts digitally.

The Contact Manager project is developed to simplify the process of managing contacts in an organized way. It provides an easy-to-use interface where users can add, edit, delete, and search contacts. This project demonstrates the use of database management and web technologies to store and retrieve contact information efficiently.

2. Project Overview

The Contact Manager project is a web-based application that helps users manage their contacts in one place. The system allows users to store multiple contacts and update their details whenever necessary.

Users can add new contacts, view saved contacts, modify existing details, and remove unwanted contacts. The system stores all data in a database, ensuring that information is saved securely and can be accessed anytime.

This project mainly focuses on improving contact organization and reducing manual record keeping.

3. Project Instructions

To use the Contact Manager system, the user must follow these steps:

1. Open the Contact Manager application in a web browser.
2. Register or log in to the system (if login is available).
3. Navigate to the dashboard or home page.
4. Click on “Add Contact” to create a new contact.
5. Enter contact details such as name, phone number, and email.
6. Save the contact to store it in the database.
7. Use edit options to update existing contact details.
8. Use delete options to remove unwanted contacts.
9. Use the search feature to find contacts quickly.

4. Pre-Requisites

Before running the Contact Manager project, the following requirements must be available.

Hardware Requirements

Computer or Laptop

Minimum 4GB RAM

Internet Connection

Software Requirements

Web Browser (Chrome, Edge, Firefox)

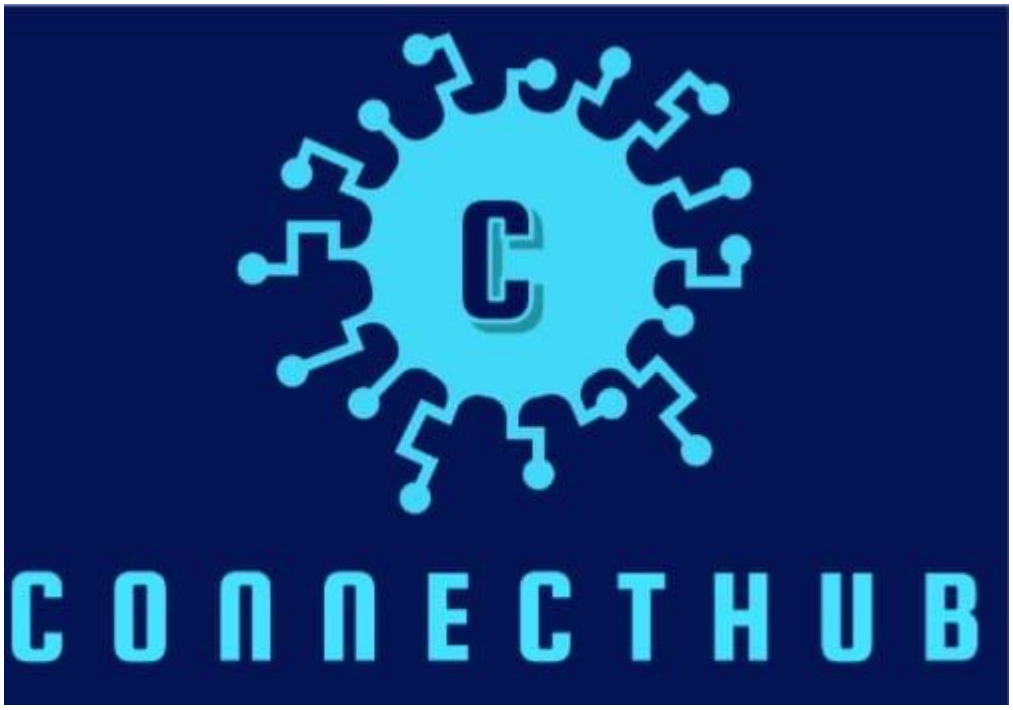
Programming Language (Java / Python / PHP / Node.js depending on project)

Database (MySQL / MongoDB)

Code Editor (VS Code / Eclipse)

Web Server (XAMPP / Apache / Node Server)

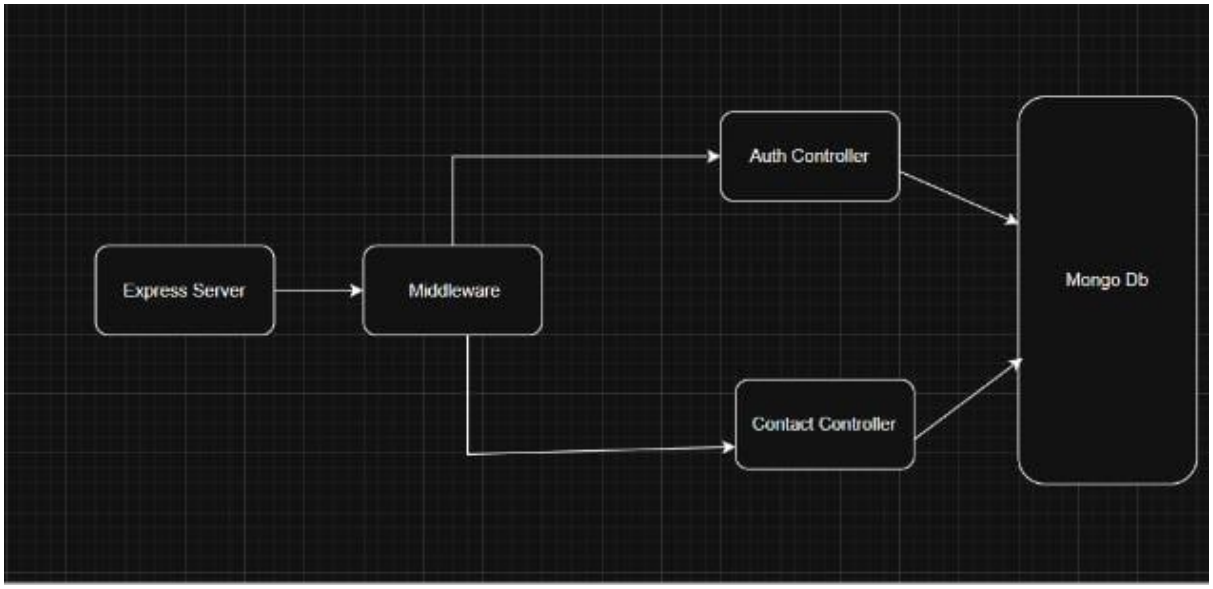
5. Project Thumbnail



The Contact Manager project is a simple application designed to maintain personal and professional contact information. It provides users with a clean interface to store and manage contacts digitally.

The main goal of the system is to provide a centralized platform where users can organize their contacts efficiently. The system improves accessibility, reduces data loss, and allows quick retrieval of contact information.

6. Project Architecture



The Contact Manager system follows a three-tier architecture:

1. Presentation Layer (Frontend)

This layer provides the user interface. Users interact with the system through web pages where they can add, view, edit, or delete contacts.

2. Application Layer (Backend)

This layer handles the business logic of the system. It processes user requests and communicates with the database.

3. Data Layer (Database)

This layer stores contact information such as name, phone number, and email in a structured database.

This architecture ensures better performance, scalability, and security.

7. Technical Architecture

The technical architecture of the Contact Manager project includes the following components:

Frontend: HTML, CSS, JavaScript

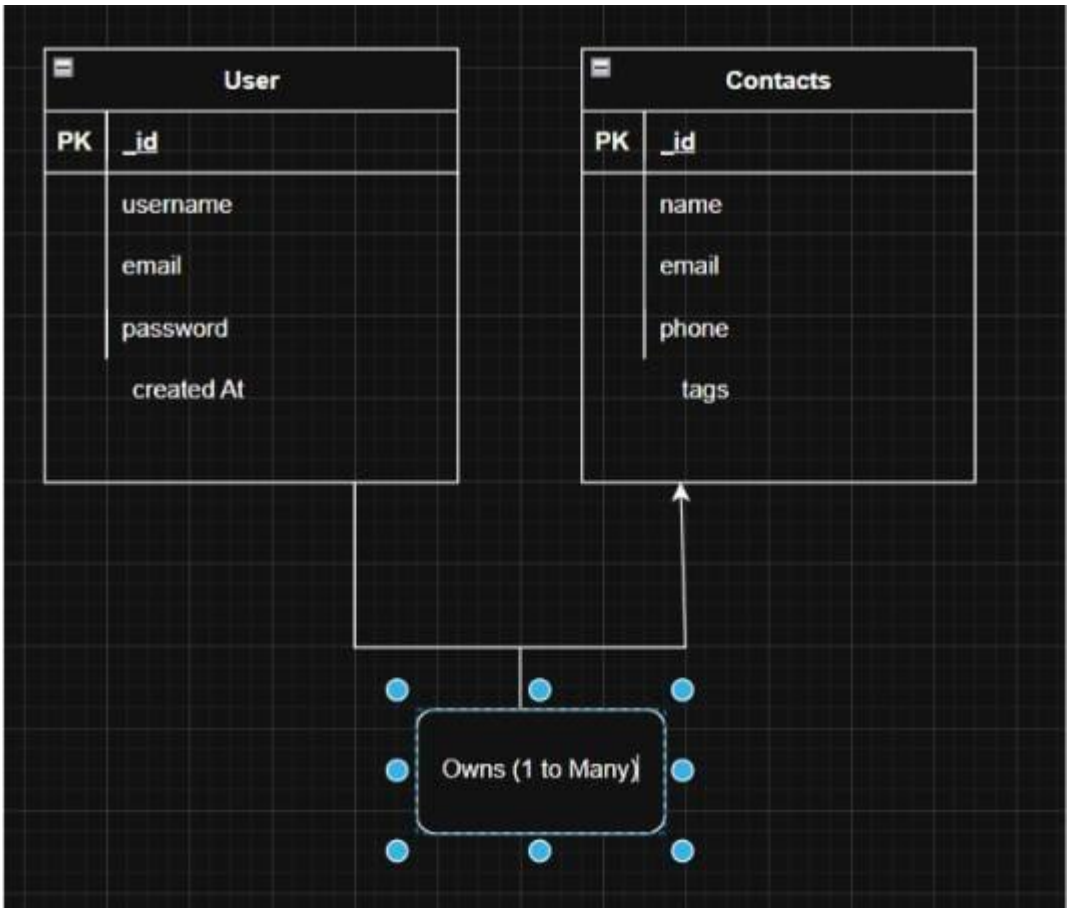
Backend: Node.js / Java / Python / PHP

Database: MySQL or MongoDB

Server: Apache or Node Server

The frontend handles the user interface, the backend processes requests, and the database stores all contact information.

8. ER Diagram



The Entity Relationship (ER) Diagram represents how data is structured in the system.

Main Entity: Contact

Attributes:

Contact_ID (Primary Key)

Name

Phone_Number

Email

Address

The Contact entity stores all information related to each user contact. Each contact has a unique Contact_ID which helps in identifying and managing records in the database.

9. Features

The Contact Manager project includes the following features:

Add new contacts

View contact list

Edit contact information

Delete contacts

Search contacts

User-friendly interface

Secure data storage

Fast data retrieval

These features help users manage their contacts easily and efficiently.

10. Database Configuration and Setup

The database is used to store all contact information securely.

Steps to configure the database:

1. Install MySQL or any database management system.

2. Create a database named contact_manager.

3. Create a table named contacts.

Example table structure:

Field	Type
Contact_ID	INT (Primary Key)
Name	VARCHAR
Phone_Number	VARCHAR
Email	VARCHAR
Address	TEXT

4. Connect the database with the backend application.

5. Ensure proper database connection settings such as hostname, username, password, and database name.

11. Project Execution

To run the Contact Manager project, follow these steps:

1. Install required software such as Node.js / Java / XAMPP.

2. Download or open the project source code.

3. Configure the database connection.

4. Import the database tables.

5. Start the server

6. Open a web browser and enter the project URL (for example: localhost:3000).

7. The Contact Manager application will open and be ready to use.

The system will allow users to manage contacts efficiently through a simple and interactive interface.
